

Passwortmanagement

To store and manage your passwords, we suggest to use a password management software.

KeePass

Description

Basically, [KeePass](#) is a programme to manage your passwords. KeePass saves the usernames and respective passwords as well as some other data in a data base and encrypts and stores them as one file. The main functions are:

- Saving of usernames, passwords etc.
- Logging those as an encrypted file
- Opening of the KeePass database with one (!) main key (e.g. a password)
- Transfer of usernames and passwords into other programmes through the clipboard.
- Automatic entry of username and password in the respective application (e.g. Firefox) via a global shortcut (Auto-Type).

During the first call, the data base is being created and the name for the respective file is being queried. Also, the main key (e.g. a strong and save password) needs to be entered at this point.
